Week 14: Final demos

AI Development Course

Show what you built

The deal screener's DEMO.md was run for real on 13 October 2026, and its fallback with the network off. A signed-in session was tested in Windows (WSL); GitHub, the timed rehearsals and Mac are being tested.

Today

- What the final demo is
- Get your project ready on `main`
- Write and rehearse a 3-minute demo
- Write `FINAL.md`
- On the day
- The 30-point rubric

The demo rules

1. **No key ever on screen**
2. **Every number is real**, and links to a file
3. **Show one honest limit**
4. **Have a fallback** for when the room's network fails

What you hand in

Part	Points
Your 3-minute demo, in class	10
Your project as it stands on `main`	10
`FINAL.md`, about two pages	10

Models: `example-project/DEMO.md` and `example-project/FINAL.md`

Ready on main

- Tests pass with `.env` moved out
- `REVIEW.md`: a Decision and a Reason for every finding
- Week 12 and 13 results committed
- No key anywhere in the history (week 13 step 1)
- The README says how to run it; Docker builds it and runs the tests
- Private repo, your instructor a collaborator (not scored, but needed)

Branch `final`; Claude Code checks the list, **you** fix things.

The deal screener's demo

Time	Show
0:00	The problem, in one sentence
0:15	The listing step on listing B: PASS, $430.53 a month
1:05	The agent: same answer, from the calculator tool
1:45	The saved results: week 12, then week 13 before and after
2:20	One honest limit: case 14, answered two ways
2:45	What AI did, what I decided

Rehearsed estimate: about 2:40.

Each row of DEMO.md

Five columns: **Time**, **Show**, **Command and where to type it**, **Say**, **If it fails**

- **Say:** one or two plain sentences
- **If it fails:** what you switch to, and the one sentence you say

The fallback

```
python3 -m unittest       # no key, no network
head -7 evals/results/...  # the saved runs
```

The deal screener's fallback ran with the network switched off: all tests ran, every results file opened.

Don't debug in front of the room.

Rehearse

1. Twice with a timer, running the real commands
2. Over time? Cut what `DEMO.md` says to cut first
3. Keep the AI step and the honest limit
4. Once with the fallback

Say less, don't talk faster.

FINAL.md: seven headings

1. What it does and who it's for
2. How it's built, and which parts are AI
3. What I measured
4. What went wrong and what I changed
5. Risks and responsible use
6. What AI did and what I decided
7. What I'd do next

Every number links to a file

- Claude Code drafts it from **your** repo
- A number with no file: **leave it out**
- Then you rewrite it in your own words
- Click every link

Heading 6 matters most

> Claude Code wrote nearly all of the code, the tests, the evaluation cases and most of the text in this folder, working from plans that I approved

- What did AI write?
- What did **you** decide: the plan, the rules, the fixes?
- What would you do differently?

On the day

- A window with **no key loaded** (or loaded once, before sharing)
- Large text; notifications off; other tabs closed
- `DEMO.md` on paper or your phone, not on screen
- A step fails: one sentence, then the fallback
- A key shows: pause, delete it first, then the fallback

The rubric (30)

Criterion	Points
Demo: works or good fallback 4, AI feature 2, honest limit 2, on time 2	10
Project on main: tests 2, REVIEW.md 2, results 2, no key 2, run and Docker 2	10
Write-up: seven headings 4, numbers traceable 3, heading 6 honest 3	10

Fourteen weeks

From "what is a model?" to a tested, reviewed, evaluated and secured AI feature, merged through pull requests.

Thank you, and good luck with your demos.
